1. In the access matrix, show what configurations enable:
   - A permission to be copied to another domain.
   - A permission to be removed from a domain.

2. Given the following Take-Grant configuration: can u w y? (Show the sequence of steps or explain why not).

3. What are the limitations of the Unix protection model in providing adequate access controls?

4. How does POSIX 1e address the protection limitations described in the last question.

5. Show how Type Enforcement can implement Bell-LaPadula without using any (explicit) lattice.

6. What problems are CMW’s information and sensitivity labels trying to solve. Give an example of where they are helpful.
